

This week was the third week of the internship. I felt that this work suit for me because it always stimulates my curiosity. My former major in Japan was international relations and there is a lot of global issues which we have to tackle with. I always consider that if we use some technology such as blockchain, we can make decentralized world and it makes all of the people easy to open bank accounts, donating money, transporting goods. International Relations is kind of humanity studies, but integrating scientific field of study, I believe we can make better world.

The exact work which I had done this week was so called “machine learning”. I use company’s big data such as retention rates, churn rates, subscription rates. Then I analyzed these data by using Python and machine learning. Our company is food company so of course there are big differences in terms of food preferences between gender, nationality and simply among people. I am so interested in revealing what factors affects people’s decision and this continues next week as well. I will work hard!
